AtlasEye Nuclear

Software for nuclear supply-chain readiness

Supplier evidence, fuel acquisition and transport readiness

\$2.0M seed opportunity

Marty Yavorcik Cofounder

atlaseye.ai

Investment thesis

A reactor can be licensable and still be commercially impossible

Nuclear teams must connect supplier records, regulatory requirements and contract obligations before committing capital. AtlasEye is developing software that binds readiness claims to evidence and accountable review. Our first proposed sale is a supplier-readiness pilot that can convert to an annual workspace.

LONG-TERM AIM

The first system opened when a project begins

The last system checked before readiness is declared

Investment thesis: repeatable software revenue from evidence workflows customers must maintain

Founders and company structure

Legal judgment and infrastructure delivery experience, building AtlasEye together

Marty

Marty Yavorcik, cofounder and Ohio attorney. Focus: evidence, authority and accountable decisions.

Matt

Matt Yavorcik, Partner and Cofounder. Infrastructure executive with 20+ years in EPC and critical facilities.

LLC

AtlasEye Nuclear operates through L8FORCOURT. LLC, an Ohio LLC. Development and provisional application funded by Marty.

■ Planned Ohio roles

Product engineering and customer implementation, subject to financing and the hiring plan.

■ Last 12 months

\$0 revenue; \$5,000 in expenses personally funded by Marty. No outside capital raised.

Matthew bio: epcprojectconsulting.com/about-us/. Ohio hiring remains a proposed plan.

The deployment gap

Every dependency can look healthy while the project remains blocked

One unresolved dependency can stop financing, contracting or construction

■ Fragmented evidence

Requirements live in contracts, regulations, engineering files, spreadsheets and individual judgment.

■ Premature readiness claims

Teams can report progress without proving that the governing evidence is current, reviewed and applicable.

AtlasEye Mission Control

Product architecture under development

■ Fail closed

Design rule: missing, conflicting or stale evidence must block a positive readiness decision.

■ Preserve history

Evidence fingerprints and replacement history support reconstruction of earlier decisions.

Human judgment remains accountable. AtlasEye organizes and tests the evidence supporting that judgment.

Nuclear lifecycle coverage

- Resource and conversion
- Enrichment and fabrication
- **Transport and receipt**
- **Siting and licensing**
- Construction and operations
- Decommissioning and records

Expansion vision. Current work focuses on applicant, fuel, transport and supplier readiness.

First customer: a nuclear supplier

Proposed pilot for a quality or commercial leader preparing a customer qualification package

A	Pilot scope One product, one buyer requirement set and a bounded evidence package	Paid pilot
B	Success measures Measure preparation time, missing evidence and reviewer acceptance against a baseline	Measured value
C	Annual workspace Maintain current evidence, revisions and customer-specific readiness records	Renewal test

Proposed commercial sequence. Signed pilots and conversion results are not yet established.

Buyer alternatives and differentiation

Customer evaluation should test the evidence supporting each readiness decision

Category	Common use	Buyer question	AtlasEye approach
Consulting and legal services	Expert interpretation	Can the work repeat across projects?	Reusable requirement and evidence structure
Document and data rooms	Storage and collaboration	Which current evidence supports a claim?	Links between claims, sources and review
AI search and drafting	Retrieval and document assistance	Who reviewed the answer and its evidence?	Accountable review and decision history
Project management systems	Schedule and work tracking	What unresolved dependency blocks readiness?	Requirement-level blockers and ownership

Positioning hypothesis for customer testing. Product-level competitive diligence remains necessary.

Customer expansion plan

- | | | |
|----|---------------------------------|---|
| 01 | Component suppliers | Initial target: qualification evidence for a specific customer opportunity. Buyer: quality or commercial lead. |
| 02 | Reactor developers | Expansion: applicant and supplier readiness before major capital commitments. Buyer: licensing or program lead. |
| 03 | Fuel and transport teams | Expansion: contract, package and delivery-readiness evidence. Buyer: procurement or logistics lead. |
| 04 | Owners and capital teams | Later expansion: project diligence and continuing readiness review. Buyer: project director or risk lead. |

Proposed growth path: a bounded paid pilot, then annual evidence maintenance and more workspaces

Proposed revenue model

Initial revenue validation centers on software and implementation

1	Readiness engagement	Fixed-fee assessment, regulatory crosswalk and evidence plan	Pilot target
2	Recurring platform	Annual workspace subscription by program, site or enterprise	Core model
3	Supplier network	Supplier qualification workspace and controlled evidence maintenance	Scale layer
4	Fuel Markets	Future transaction services require a documented authorization path and separate capital	Future option

Raise proceeds fund software, regulatory clarity and customer pilots. Separate capital would fund any future transaction exposure.

Illustrative annual revenue scenarios

Unvalidated pricing and account assumptions. These scenarios do not establish TAM.

ASSUMPTIONS

Early: 10 at \$150K

Later: 50 at \$250K

Plus 500 at \$20K

\$22.5M later ARR

Later case: $\$12.5\text{M} + \$10\text{M} = \$22.5\text{M}$. It replaces the early \$1.5M case. Services and transactions excluded.

Current progress

Product development and regulatory engagement as of September 9, 2026

■ Platform foundation

Prototype readiness model and evidence workflows. Full lifecycle deployment remains a roadmap.

■ Supplier intake

AWS-backed submission and review workflow tested. Intake records do not establish supplier approval.

■ Focused modules

Part 53 applicant readiness, fuel acquisition, transportation and supplier intake workstreams

■ Regulatory engagement

NRC materials preapplication hypothetical submitted for jurisdiction and authority discussion

■ Commercial development

Pre-revenue: \$0 in the last 12 months. Industry demonstrations and outreach; pilot conversion remains to be established.

■ Intellectual property

Provisional patent application filed and personally funded by Marty. Filing and ownership records for diligence.

Prototype stage. No production readiness, NRC approval, materials license or completed fuel transaction is claimed.

Proposed 18-month milestones and budget

0-3 months	Target: scoped design partners Engineering lead recruited Pilot baseline and authority questions mapped
4-9 months	Target: paid supplier pilot Measured evidence-review outcomes First annual subscription conversions
10-18 months	Target: repeatable onboarding Renewal and expansion evidence Fuel and transport software expansion

\$2.0M proposed seed budget

Management proposal. Actual allocation will follow the financing terms, hiring sequence and regulatory path.

EVERGREEN DISCUSSION

\$2.0M seed raise

\$1.0M first close \$2.5M hard cap

Target dilution: 12% to 18%

Proposed capital supports AtlasEye software, regulatory architecture and customer pilots

Future fuel inventory and transaction exposure would require separate capital and authority
